

# DR-108

## Dealer Manual Service Manual

VHF

### \* SPECIFICATIONS

#### GENERAL

Frequency	DR108TE1 135.000 ~ 155.000MHz DR108TE2 150.000 ~ 173.995MHz
Step	5 , 10 , 12.5 , 15 , 20 , 25 KHz selectable
Channel	20ch
Modulation	F3E (FM)
Antenna impedance	50 ohm unbalanced
Power supply	13.8V DC +/- 10%
Current	Tx high.approxl 9A Rx squelched.less than 800mA
Dimensions	140(W) x 40(H) x 154(D)
Weight	approx 0.9kgs

#### Transmitter

Power output	25W tcontinuously adjustable to 5W
Modulation	variable reactance frequency modulation
Max deviation	+/- 2.5kHz or +/- 5.0kHz dealer setting
Spurious	-75dB or under below carrier
Residual Noise	-40dB
Microphone	Electret Condenser Microphone
Operatin Mode	Simplex/Semi-Duplex
Offset	0 to +/-15.995MHz freely programmable

#### Receiver

Receiver sys	Double-conversion superheterodyne
Sensitivity	0.25uV (-12dBu) 12dB SINAD
Selectivity	70dB
Spurious and image rejection	70dB
inter modulation	70dB
AF Output	2W with 8ohm at 10%dist. or 4W with 4ohm at 10%dist.

# 1. GENERAL

## 1-1 Using This Manual

### Dealer-Mode:

The DR-108 is shipped ex-factory without any data written in its memories, and is not operable unless it is first programmed by the dealer; in other words, the radio is in the dealer-mode.

### User-Mode:

Once the radio is programmed with the configuration and memories by the dealer, re-positioning the jumper connector on the back of the front control panel (while the radio is turned OFF) will put the radio into operable mode, or the user-mode. (See the diagram next page). The instruction booklet that comes with each radio explains operation in the user-mode. **Servicing-mode:** While in the user-mode, the radio can be put into a sub-mode called the servicing-mode: in this mode, the service staff can check the stored memories and circuits without erasing the stored data.

Abbreviation keys: BCLO = Busy Channel Lock Out: Transmission prohibited when receiving signal (of other Tones if TSQ is set).

TSQ = Tone Squelch: Radio unmuted upon receiving a signal with matching CTCSS sub-audible continuous tone.

The dealer-mode programming can be roughly categorized into two parts:

- A) Configuration refers to parameters that customizes the DR-108 in its electrical or operational settings, regardless of the channel selection. Said settings are: tuning step, Time-Out-Timer, Penalty-timer, BCLO,  key disabling, and  key disabling. (Details later)
- B) Memory/frequencies are receive and transmit frequencies, encode and decode of TSQ (CTCSS tones), for each individual channel.

Both the (A) and (B) items can be programmed either manually; or by PC with the ERW-2 Interface and software.

Note that either way, after programming, you must re-position the jumper connector in order to bring into the user-mode.

\*Names of products mentioned in this manual are used for identification purposes only and may be trade mark and/or registered trademarks of their respective company.

In this manual, the user-mode operation is briefly described in Chapter 2 "OPERATION", where minimal user operations only are explained. The servicing-mode is described in the later section of the Chapter 2.

The dealer-mode setting/programming are described in Chapter 3.

## 1-2 Specifications

### General

Frequency Coverage:	135.000-155.000MHz(TE1) 150.000-173.995MHz(TE2)
Number of channels	20 semi-duplex or simplex channels
Frequency Resolution:	5, 10, 12.5, 15, 20, 25kHz steps
Frequency Stability	$\pm 0.0005\%$ (– 20°C to 60°C)
Antenna Impedance:	50 $\Omega$
Power Supply Requirement:	13.8V DC $\pm 10\%$
Current Drain at 13.8V:	Receive: less than 800mA (No sound) Transmit: 9A(approx.at 25W)
Dimensions (without projection):	140mm (W) $\times$ 40mm (H) $\times$ 154mm (D) 5.51" (W) $\times$ 1.58" (H) $\times$ 6.06" (D)
Weight (body only):	0.9kg (approx.)

### Transmitter

Output Power	25W continuously adjustable to 5W
RF output Impedance	50 $\Omega$
Emission Mode	F3E $\pm 5$ kHz; or F3E $\pm 2.5$ kHz
Spurious and harmonics	– 70dB
Residual Noise	– 40dB
Frequency split	$\pm 16$ MHz MAX. from receive frequency

### Receiver

Sensitivity	0.25 $\mu$ V
Selectivity	70dB
Spurious and image rejection	70dB
Inter Modulation	70dB
Audio output	2W at 8 $\Omega$ less than 10% distortion, or 4W at 4 $\Omega$ less than 10% distortion

## 2. OPERATION

### 2-1 User-Mode

Press the power switch (orange) to toggle the power on and off.

1. Pressing the  key toggles to override the Tone Squelching, if the decoder has been set. (Note: The  key can be abled/disabled in the dealer-mode). Removing the microphone from its hook also overrides the Tone Squelching.
2. Pressing the  key toggles to unmute/mute the squelch. (Note: The  key can be abled/disabled in the dealer-mode).
3. Adjust the volume control (  ) for a normal listening level, having unmuted the audio.
4. Rotate the Channel selector (  = dial) to desired channel.
5. Press the microphone's PTT key to transmit and talk. Release PTT to receive and listen.
6. Put back the microphone to the hook; press  key, and  key, to toggle back the Tone Squelching and squelching.

### 2-2 Servicing Mode

This mode lets a service-person to check what have been programmed in the radio without going back to the dealer-mode. Assuming a radio is in the user-mode:

1. Holding down the  key, turn the power on, and keeping down the  key press the  key five strokes. Then release the  key.
2. Press the  key five strokes.
3. The radio is now under the servicing mode. Select a channel with the channel selector; each press of the  key scrolls the memory content display for that channel.
4. To come back to the user mode, turn off the radio.

## 3. DEALER-MODE

- Note: (i) The DR-108 can be programmed manually by following the steps described in this chapter. In this case the DR-108 must be in the dealer-mode during the entire programming operation.
- (ii) Alternatively, the DR-108 can be programmed by PC interfaced with the ERW-2B programmer. In this case we recommend that the DR-108 be first put into the user-mode.

### 3-1 Initializing

Initialization erases all data in configurations and memories, and the data will be ex-factory default, and the radio automatically is put into the configuration setting mode (see section 3-2). To initialize, press and hold the  key and turn on the power.

### 3-2 Configuration setting mode

When the DR-108 is in the dealer-mode, press and hold the  key and turn on the power to set the radio to the configuration setting mode. This procedure sets to the configuration setting mode without going through the initializing (sec. 3-1), thereby preserving the previously programmed configurations and memories.

Once the DR-108 is in the configuration setting mode, operate in the following sequences to set the configurations:

1. As soon as the DR-108 is put into the configuration setting mode, select the **channel step** by rotating the dial. (A choice of 5, 10, 12.5, 15, 20, or 25kHz) Then press the  key to set.
2. Now select the **time-out-timer** with the dial (upto 450 seconds in 30 sec step; note that "000" means there is no time-out setting). Then press the  key to set.
3. Now select the **penalty-timer** with the dial (upto 15 seconds in 1 sec step). The penalty will disallows transmission for the set duration after the DR-10 times out by the time-out-timer. The penalty-timer is valid only if the time-out-timer has been set. Then press the  key to set.
4. Now select, using the dial, the **Busy-Channel-Lock-Out** setting (ON = "4-1"/OFF = "4-0"). Then press the  key to set.
5. Now select, using the dial, whether to **enable or disable** the  key during the user-mode. (Enable = "5-1"/Disable = "5-0"). Then press the  key to set.
6. Now select, using the dial, whether to **enable or disable** the  key during the user-mode. (Enable = "6-1"/Disable = "6-0"). Then press the  key to set.

Now the configuration settings are complete. Turn off the power. Continue to section 3-3.

### 3-3 Memory/Frequency programming mode

Having completed the configuration settings, you can now program the memory frequencies and the CTCSS tone settings. Turn on the power.

1. As soon as the DR-108 is put into the memory/frequency programming mode, select a **channel number** using the dial where you wish to program the frequency and tone.  
Then press the  key.
2. By rotating the dial, bring the display to the **receiving frequency**.  
(To change in 1MHz order, press the  key and rotate the dial. To return in normal order, press the  key again.)  
Then press the  key.
3. By rotating the dial, bring the display to the **transmission frequency**.  
The transmission frequency is limited to  $\pm 15.995\text{MHz}$  from the receiving frequency.  
(To change in 1MHz order, press the  key and rotate the dial. To return in normal order, press the  key again.)  
Then press the  key.
4. By rotating the dial, bring the display to the **CTCSS tone decode** frequency.  
Note that "0.0" means the TSQ is not set.  
Then press the  key.
5. By rotating the dial, bring the display to the **CTCSS tone encode** frequency.  
Note that "0.0" means no tone is encoded.  
Then press the  key.
6. The programming for the channel has been completed, and the display now shows the next channel. You can now program a new channel number. (If you wish to program a channel number other than the one now displaying, simply rotate the dial to your choice). Press the  key and go to the step 2 above.  
If you wish to end the programming, turn the power off.

Having completed the configuration and memory/frequency programmings, put the radio into the user-mode by re-positioning the jumper connector (see Section 1-1).

### 3-4 Channel Spacing Conversion

The DR-108 has been made to comply with 25kHz (20kHz) spacing or 12.5kHz spacing. It can be changed by solder-jumper setting by the dealer in the following manner:

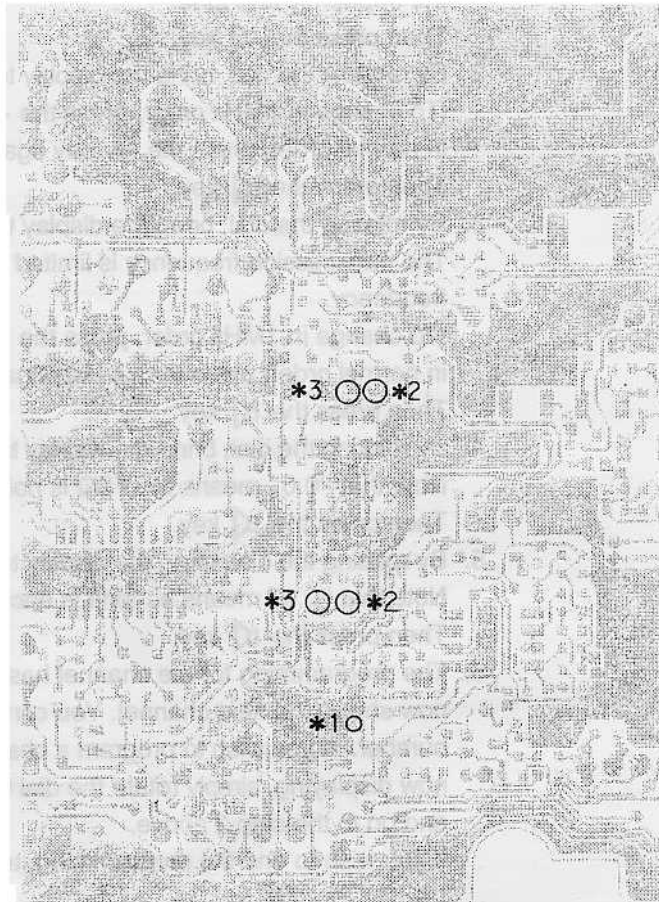

1. Deviation    5kHz is set by removing the solder-bridge at the location \*1.  
                  2.5kHz is set by solder-bridging the location \*1.
2. Filter        Normal filter is set by solder-bridging the location \*2, and opening \*3.  
                  Narrow filter is set by solder-bridging the location \*3, and opening \*2.

### 3. Default initial frequency

Shorting the R278 and opening the R266 will give 155.00MHz.

Opening the R278 and shorting the R266 will give 136.00MHz.

# CIRCUIT DESCRIPTION

VHF

## 1) Receiver System

1. **Front End:** The signal from the antenna is passed through a low-pass filter and input to pre-selector circuit consisting of L17/L14. The signal from L14 is led to the gate of Q1. D19 is the diode limiter circuit against the excessive input power of more than 20dBm. Q1 is the FET which has two gates. The voltage of the gate 2 is set higher to get the high gain and sensitivity. The signal from Q1 is led to the triple band pass filter (L4, L5, L6) and gets the high image rejection ratio.
2. **Mixer Circuit:** The signal from the triple band pass filter is converted into the first IF signal of 21.4MHz. The receiving signal is led to the gate 1 of Q2, and the first local oscillator signal is led to the gate 2 of Q2. To get the high conversion gain, the local oscillator signal voltage is set to about 1V. To reduce the high adjacent channel interference, the bandwidth is set to 15kHz. The signal from FL2/FL3 is amplified by Q8, and input to FM IF system IC3 of TK10487.
3. **I.F. Circuit:** The TK10487 has the second local oscillator circuit, mixer circuit, detector circuit, squelch circuit, and so on. Pins 1 and 2 are the terminals of the crystal oscillator circuit. Pin 2 (emitter) is connected to the ground via the resistor R3 to prevent the oscillator from decreasing the power at the low temperature. Pin 4 of IC3 is connected to FL1 directly because the matching resistor for ceramic filter is built-in. The quadrature circuit (pin 10 of IC3) is connected to the ceramic resonator X2 for the temperature stability and good quality. The signal from pin 11 of IC3 is connected to the LPF. The detected AF signal, which has flat frequency characteristics, is led to the control unit and used as tone squelch signal. De-emphasis circuit consists of R31, R32, C26, and C27. The LPF amplifier consisting of Q5 and Q6 is located far away from the VR in the control unit, so it outputs the high voltage signal to prevent S/N from the deterioration. The squelch switch circuit consists of Q4 and Q16, and switches on/off at the point where there is no voltage to prevent from the switching noise. The S-meter signal from pin 12 of IC3 is led to the CPU in the control unit after adjusting the level at D20 and VR5. The S-meter signal is thermal compensated by TH1 and stabilized. The noise amplifier consists of pins 13 and 14, the built-in OP Amp in IC3. The output signal of noise amplifier is amplified by Q14, rectified by D5, and then led to the pin 15 (hysteresis comparator input) of IC3.
4. **A.F. Circuit:** IC4 is about 5W audio power amplifier IC. When the capacity of pin 1 in C16 is increased more, the output incidental noise becomes smaller. The high-pitched tone becomes smaller at the same time. This radio's capacity of C16 is determined considering the high-pitched tone.

## 2) Transmitter System

1. **Modulation Circuit:** The microphone amplifier IC1 (IDC, LPF) consists of two operational amplifiers. The signal from the microphone is led to pre-emphasis circuit consisting of C36 and R47 and then to the limiter circuit. The limiter circuit uses the saturation of the OP amplifier. The amplified signal is input to the low-pass filter IC1A. The output signal from the microphone amplifier is passed through variable resistors VR2 for modulation adjustment and input to the VCO unit. Sub tone deviation is determined by R24, R25, and VR2. The radio does not have the adjustment variable resistor for sub tone deviation.
2. **TX Amp. Circuit:** The signal from VCO is amplified by TX, RX wide band LO amplifier Q19. The signal from Q19 is passed through the transmission/reception selector, and amplified by Q20 and Q15. The PA unit is driven at 200mW driving power.
3. **P.A. Circuit:** IC5 is 25W powered amplifier module. The output power is controlled by the voltage of V1. The RF signal amplified 25W in PA is passed through D3 and a four-stage transmission/reception low-pass filter, and input to the antenna connector.
4. **ALC Circuit:** The power detection circuit consisting of D17 and D18 rectifies the output signal voltage. The detected DC voltage is led to the VR1 (power adjust trimmer), and amplified by Q3, Q9, and Q13. Output power is controlled by voltage of V1 in IC5 and collector voltage of Q15. When the temperature goes up unusually, the power down circuit consisting of R101 and TH2 works to prevent the device from the destruction.

### **3) PLL Circuit**

The VCO unit is designed for the PLL circuit, putting the VCO on one side, and PLL circuit on the other side. Q301 in the VCO is grounded using the gate oscillator, and its frequency covers 134MHz to 174MHz without transmission/reception shift circuit. IC301 is pulse swallow system based PLL IC with the built-in prescaler, which synthesizes 150MHz band signal. The loop filter consisting of Q302 and Q303 is the active type.

## ADJUSTMENT

### 1) Required Test Equipment

#### 1. Digital Multimeter

Voltage range: FS= 18V or so  
Input resistance: 1M ohm or more

#### 2. Regulated Power Supply

Supply voltage: 13.80V  
Current : 15A or more

#### 3. Oscilloscope

Measurable frequency: DC to 30MHz

#### 4. Spectrum Analyzer

Measuring range: Up to 2GHz or more

#### 5. Tracking Generator

Output frequency: Up to 2GHz or more

#### 6. Audio Dummy Load

Impedance: 8 ohm  
Dissipation: 5W or more

#### 7. SSG

Output frequency: 1GHz or more  
Output level: -20dB/0.1uV to 120dB/1V  
Modulation: FM

#### 8. Frequency Counter

Measurable frequency: Up to 500MHz  
Measurements stability: 0.2ppm or so

#### 9. Power Meter

Measurable frequency: Up to 500MHz  
Impedance: 50 ohm, unbalanced  
Measuring range: Full scale of 60W or so

#### 10. Audio Voltmeter

Measurable frequency: 50Hz to 10kHz  
Sensitivity: 1mV ~ 10V

#### 11. Distortion Meter

Measurable frequency: 1kHz  
Input level: Up to 40dB  
Distortion level: 1% - 100%

#### 12. Audio Generator

Output frequency: 88.5Hz and 1kHz  
Output impedance: 600 ohm, unbalanced

#### 13. Linear Detector

Measurable frequency: Up to 500MHz  
Characteristics: Flat  
CN: 60dB or more

## 2) Adjustment for DR108TE1

SSG Mod:1KHz +/-1.75KHz/DEV

SP terminal is connected to 8ohm dummy load.

RX speaker output level is 50 to 100mW

1. Power supply voltage is 13.8V. Power switch is off.

2. Turn the squelch and volume knobs counterclockwise.

3. Press and hold the "F"key,then turn on the power switch.

The display shows that the frequency is 155.00MHz

### PLL Adjustment

Item	Condition	Measurement			Adjustment			Specification/
		Test equipment	Unit	Terminal	Unit	Parts	Method	Remarks
Frequency	Frequency:145.00MHz power: Low PTT: ON	Freq.Counter Power Meter	Back	ANT	MAIN	TC1	145.00 MHz	+/- 100Hz
PLL VCO	Frequency:130.00MHz PTT: OFF	Digital Multimeter	Main	SD	PLL VCO	L302	0.85V	0.75-0.85V

### RX Adjustment (ALL SSG out =EMF)

Item	Condition	Measurement			Adjustment			Specification/
		Test equipment	Unit	Terminal	Unit	Parts	Method	Remarks
RX Sensitivity	Frequency:145.03MHz SSG out:0dBu	SSG Distortion Meter	Main	TP1	Main	L4-L6 L14	SINAD: MAX	Turn the coil L14, L4,L5,L6,L4,L5 to the MAX in order
	Frequency:136.03MHz SSG out:-10dBu							SINAD is above12dB
	Frequency:145.03MHz SSG out:-8.0dBu						Check	
	Frequency:155.03MHz SSG out:-8.0dBu							
	Frequency:130.03MHz SSG out:10.0dBu							
S Meter	Frequency:145.03MHz SSG out: 15dBu Mod: OFF	LCD S Meter	Front Panel		Main	VR5	Full flashing	
	Frequency:145.03MHz SSG out: off Mod: OFF						Check	S Meter does not light.
SQL	Frequency:145.03MHz  SQL VR:Threshold	LCD Busy	Front Panel		Main		Make sure that SQL is open	Busy ON

### TX Adjustment

Item	Condition	Measurement			Adjustment			Specification/	
		Test equipment	Unit	Terminal	Unit	Parts	Method	Remarks	Remarks
High Power	VR1: max Power:High PTT: ON	Power Meter	Back	ANT	Main				
	Frequency:145.00MHz Power:High PTT: ON					VR1	34w	+/- 1.0W Below 9.5A	+/- 1.0W Below 9.5A
	Frequency:136.00MHz Power:High PTT: ON						Check	Above 5W	Above 5W
DEV	Frequency:145.00MHz Power: Low AG:1KHz -30dBm PTT: ON	AG Linear Detector Power Meter	Back	ANT	Main	VR2	2.4kHz /Dev	2.4 +/-0.2kHz/Dev	4.7kHz /Dev
MIC Gain	Frequency:145.00MHz Power: Low AG:1KHz -47dBm PTT: ON					VR4	2.0kHz /Dev	2.0 +/-0.2kHz/Dev	4.0kHz /Dev
CTCSS To DEV	Frequency:145.00MHz Power: Low AG: OFF PTT: ON ToneSW(88.5Hz):ON					VR501	0.35kHz /Dev	0.35 +/-0.1kHz/Dev	0.7kHz /Dev

If the logic board EJ-21D or EJ21D exists ,first pull out the logic board  
and re-connect W3,W4,W5, so that the radio comes back to conventional

## 2) Adjustment for DR108TE2

SSG Mod:1KHz +/-1.75KHz/DEV

SP terminal is connected to 8ohm dummy load.

RX speaker output level is 50 to 100mW

1. Power supply voltage is 13.8V. Power switch is off.
  2. Turn the squelch and volume knobs counterclockwise.
  3. Press and hold the "F"key,then turn on the power switch.
- The display shows that the frequency is 155.00MHz

### PLL Adjustment

Item	Condition	Measurement			Adjustment			Specification/
		Test equipment	Unit	Terminal	Unit	Parts	Method	Remarks
Frequency	Frequency:160.00MHz power: Low PTT: ON	Freq. Counter Power Meter	Back	ANT	MAIN	TC1	160.00 MHz	+/- 100Hz
PLL VCO	Frequency:174.00MHz PTT: OFF	Digital Multimeter	Main	SD	PLL VCO	L302	7.5V	7.0-8.0V

### RX Adjustment (ALL SSG out =EMF)

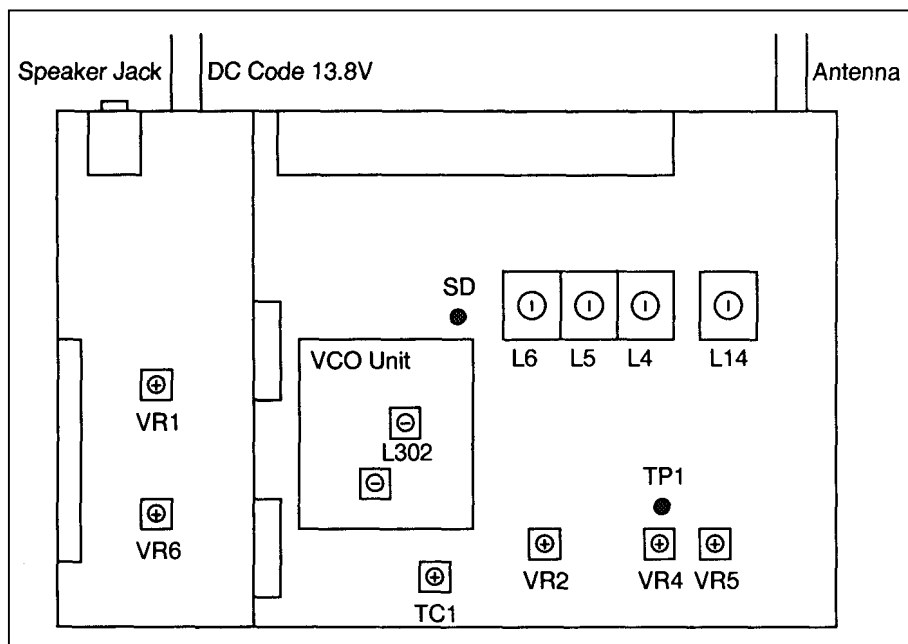

Item	Condition	Measurement			Adjustment			Specification/
		Test equipment	Unit	Terminal	Unit	Parts	Method	Remarks
RX Sensitivity	Frequency:160.03MHz SSG out:0dBu	SSG Distortion Meter	Main	TP1	Main	L4-L6 L14	SINAD: MAX	Turn the coil L14, L4,L5,L6,L4,L5 to the MAX in order
	Frequency:160.03MHz SSG out:-10dBu					Check		SINAD is above12dB
	Frequency:155.03MHz SSG out:-8.0dBu							
	Frequency:173.03MHz SSG out:-8.0dBu							
	Frequency:145.03MHz SSG out:10.0dBu							
S Meter	Frequency:160.03MHz SSG out: 15dBu Mod: OFF	LCD S Meter	Front Panel		Main	VR5	Full flashing	
	Frequency:160.03MHz SSG out: off Mod: OFF						Check	S Meter does not light.
SQL	Frequency:160.03MHz	LCD Busy	Front Panel		Main		Make sure that SQL is open	Busy ON
	SQL VR:Threshold							

### TX Adjustment

Item	Condition	Measurement			Adjustment			Specification/	
		Test equipment	Unit	Terminal	Unit	Parts	Method	Remarks	Remarks
High Power	VR1: max Power:High PTT: ON	Power Meter	Back	ANT	Main				
	Frequency:160.00MHz Power:High PTT: ON					VR1	34w	+/- 1.0W Below 9.5A	+/- 1.0W Below 9.5A
	Frequency:145.00MHz Power:High PTT: ON						Check	Above 5W	Above 5W
DEV	Frequency:160.00MHz Power: Low AG:1KHz -30dBm PTT: ON	AG Linear Detector Power Meter	Back	ANT	Main	VR2	2.4kHz /Dev	2.4 +/-0.2kHz/Dev	4.7kHz /Dev
MIC Gain	Frequency:160.00MHz Power: Low AG:1KHz -47dBm PTT: ON					VR4	2.0kHz /Dev	2.0 +/-0.2kHz/Dev	4.0kHz /Dev
CTCSS Tone DEV	Frequency:160.00MHz Power: Low AG: OFF PTT: ON ToneSW(88.5Hz):ON					VR501	0.35kHz /Dev	0.35 +/-0.1kHz/Dev	0.7kHz /Dev

If the logic board EJ-21D or EJ21D exists ,first pull out the logic board  
and re-connect W3,W4,W5, so that the radio comes back to conventional

### 3) Adjustment Points

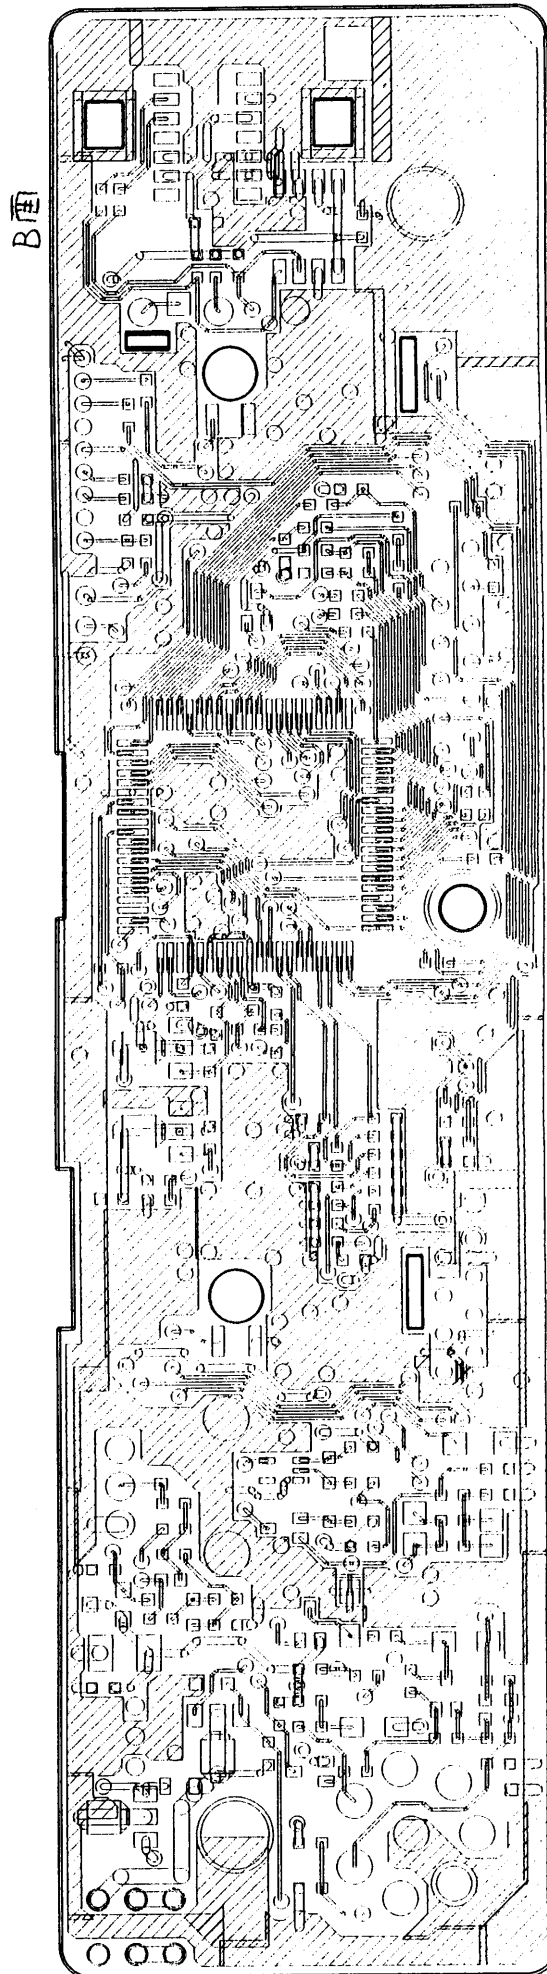

### 4) Adjustment Quick Reference

		SSG Output = EMF
