

**LC72322**

Single-Chip Microcontroller with PLL and LCD Driver

Overview

The LC72322 is a single-chip microcontroller for use in electronic tuning applications. It includes on chip both LCD drivers and a PLL circuit that can operate at up to 150 MHz. It features a large-capacity ROM, a highly efficient instruction set, and powerful hardware.

Functions

- Stack: Eight levels
- Fast programmable divider
- General-purpose counters: HCTR for frequency measurement and LCTR for frequency or period measurement
- LCD driver for displays with up to 56 segments (1/2 duty, 1/2 bias)
- Program memory (ROM): 4 k words by 16 bits
- Data memory (RAM): 256 4-bit digits
- All instructions are single-word instructions
- Cycle time: 2.67 μ s, 13.33 μ s, or 40.00 μ s (option)
- Unlock FF: 0.55 μ s detection, 1.1 μ s detection
- Timer FF: 1 ms, 5ms, 25ms, 125ms
- Input ports*: One dedicated key input port and one high-breakdown voltage port
- Output ports*: Two dedicated key output ports, one high-breakdown voltage open-drain port
Two CMOS output ports (of which one can be switched to be used as LCD driver outputs)
Seven CMOS output ports (mask option switchable to use as LCD ports)
- I/O ports*: One switchable between input and output in four-bit units and one switchable between input and output in one-bit units

Note: * Each port consists of four bits.

- Program runaway can be detected and a special address set (Programmable watchdog timer).
- Voltage detection type reset circuit
- One 6-bit A/D converter
- Two 8-bit D/A converters (PWM)
- One external interrupt
- Hold mode for RAM backup
- Sense FF for hot/cold startup determination
- PLL: 4.5 to 5.5 V
- CPU: 3.5 to 5.5 V
- RAM: 1.3 to 5.5 V

Pin Functions

Pin	Pin No.	Functions	I/O	I/O circuit type
PA0 PA1 PA2 PA3	35 34 33 32	Low-threshold type dedicated input port These pins can be used, for example, for key data acquisition. Built-in pull-down resistors can be specified as an option. This option is in 4-pin units, and cannot be specified for individual pins. Input through these pins is disabled in BACK UP mode.	Input	 <p>A02107</p>
PB0 PB1 PB2 PB3 PC0 PC1 PC2 PC3	30 29 28 27 26 25 24 23	Dedicated output ports Since the output transistor impedances are unbalanced CMOS, these pins can be effectively used for functions such as key scan timing. These pins go to the output high-impedance state in BACK UP mode. These pins go to the low level during a reset, i.e., when the $\overline{\text{RES}}$ pin is low.	Output	 <p>A02108</p>
PD0 PD1 PD2 PD3	22 21 20 19	Dedicated output ports These are normal CMOS outputs. These pins go to the output high-impedance state in BACK UP mode. These pins go to the low level during a reset, i.e., when the $\overline{\text{RES}}$ pin is low.		
PE0 PE1 PE2 PE3	18 17 16 15	I/O port These pins are switched between input and output as follows: Once an input instruction (IN, TPT, or TPF) is executed, these pins latch in the input mode. Once an output instruction (OUT, SPB, or RPB) is executed, they latch in the output mode. These pins go to the input mode during a reset, i.e., when the $\overline{\text{RES}}$ pin is low. In BACK UP mode these pins go to the input mode with input disabled.	I/O	<p>PE1, PE3</p>  <p>A02109</p>
PF0 PF1 PF2 PF3	14 13 12 11	I/O port These pins are switched between input and output by the FPC instruction. The I/O states of this port can be specified for individual pins. These pins go to the input mode during a reset, i.e., when the $\overline{\text{RES}}$ pin is low. In BACK UP mode these pins go to the input mode with input disabled.		<p>Others</p>  <p>A02110</p>
PG0 PG1 PG2 PG3	6 5 4 3	Dedicated input port Input through these pins is disabled in BACK UP mode.	Input	 <p>A02111</p>

Pin	Pin No.	Functions	I/O	I/O circuit type
PH0 PH1 PH2/DAC1 PH3/DAC2	10 9 8 7	Dedicated output port Since these pins are high-breakdown voltage n-channel transistor open-drain outputs, they can be effectively used for functions such as band power supply switching. Note that PH2 and PH3 also function as the DAC1 and DAC2 outputs. These ports go to the high impedance state during a reset, i.e., when the RES pin is low, and in BACK UP mode.	Output	 A02112
PI0/S25 PI1/S26 PI2/S27 PI3/S28	39 38 37 36	Dedicated output port While these pins have a CMOS output circuit structure, they can be switched to function as LCD drivers. Their function is switched by the SS and RS instructions. These pins cannot be switched individually. The LCD driver function is selected and a segment-off signal is output when power is first applied or when RES is low. These pins are held at the low level in BACK UP mode. Note that when the general-purpose port use option is specified, these pins output the contents of IPORT when LPC is 1, and the contents of the general-purpose output port LATCH when LPC is 0.	Output	 A02113
S1 to S24	63 to 40	LCD driver segment outputs A frame frequency of 100 Hz and a 1/2 duty, 1/2 bias drive type are used. A segment-off signal is output when power is first applied or when RES is low. These pins are held at the low level in BACK UP mode. The use of these pins as general-purpose output ports can be specified as an option.	Output	 A02114
COM1 COM2	65 64	LCD driver common outputs A 1/2 duty, 1/2 bias drive type is used. The output when power is first applied or when RES is low is identical to the normal operating mode output. These pins are held at the low level in BACK UP mode.	Output	 A02115
FMIN	74	FM VCO (local oscillator) input The input must be capacitor coupled. The input frequency range is from 10 to 130 MHz.	Input	 A02116
AMIN	75	AM VCO (local oscillator) input The band supported by this pin can be selected using the PLL instruction. High (2 to 40 MHz) → SW Low (0.5 to 10 MHz) → LW and MW

Pin	Pin No.	Functions	I/O	I/O circuit type
HCTR	70	Universal counter input The input should be capacitor coupled. The input frequency range is from 0.4 to 12 MHz. This input can be effectively used for FM IF or AM IF counting.	Input	
LCTR	71	Universal counter input The input should be capacitor coupled for input frequencies in the range 100 to 150 kHz. Capacitor coupling is not required for input frequencies from 1 to 20 Hz. This input can be effectively used for AM IF counting. This pin can also be used as a normal input port.		
ADI	69	A/D converter input A 1.28 ms period is required for a 6-bit sequential comparison conversion. The full scale input is $((63/96) \cdot V_{DD})$ for a data value of 3FH.	Input	
INT	66	External interrupt request input An interrupt is generated when the INTEN flag is set (by an SS instruction) and a falling edge is input. This pin can also be used as a normal input port.	Input	
EO1 EO2	77 78	Reference frequency and programmable divider phase comparison error outputs Charge pump circuits are built in. EO1 and EO2 are the same.	Output	
\overline{SNS}	72	Input pin used to determine if a power outage has occurred in BACK UP mode This pin can also be used as a normal input port.	Input	
\overline{HOLD}	67	Input pin used to force the LC72322 to HOLD mode The LC72322 goes to HOLD mode when the HOLDEN flag is set (by an SS instruction) and the \overline{HOLD} input goes low. A high-breakdown voltage circuit is used so that this input can be used in conjunction with the normal power switch.	Input	
\overline{RES}	68	System reset input This signal should be held low for 75 ms after power is first applied to effect a power-up reset. The reset starts when a low level has been input for at least six reference clock cycles.	Input	
XIN XOUT	1 80	Crystal oscillator connections (4.5 MHz) A feedback resistor is built in.	Input Output	
TEST1 TEST2	2 79	LSI test pins. These pins must be connected to V_{SS} .	—	—
V_{DD} V_{SS}	31, 73 76	Power supply	—	—

Development Environment

- The LC72P321 is used for OTP.
- The LC72EV321 is used as the evaluation chip.
- A total debugging system is available in which the TB-72EV32 evaluation chip board and the RE32 multi-function emulator are controlled by a personal computer.
